The Great Flood, and its mechanism! Rising underground waters would have released Carbon Dioxide/Monoxide and other gasses. It was possibly a selective extinction of large fauna in *c*. 40-20K BC.

The Result? The Reduction of Gigantism, in humans, animals, and real extinction of the dinosaurs?

A New Explanation, for the disappears of huge animals, huge humans, dinosaurs.

Abstract

About 30,000 years ago megafauna and possibly even very large humans began to die out. We include a second dinosaur extinction in this. It is wrong to say that dinosaurs ever 'died out'. Rather, large dinosaurs died out, repeatedly. Small dinosaurs are still everywhere, the birds. (T-rex is a large chicken, genetically. Imagine a crazy rooster chasing you.)

1

We propose that carbon monoxide and dioxide, and other volcanic gasses, released from the ground about 30,000 years ago, resulted in the selective extinctions of large animals. Unlike small animals, large animals cannot diffuse oxygen from lungs to bloodstream or tissues, without means of actual blood vessels, and lots of tubes. These larger creatures would therefore have been selectively exterminated by gasses which poison the system by not allowing oxygen into the bloodstream. The larger the animal, the bigger the problem. This would have a natural-selection effect in a highly-volcanic, prehistoric world, making species smaller.

We go further with an 'attachment' to this insight of natural selection by volcanism, the *mechanism for its action*. That is, a reduction *in the size of the planet*. This would have increased underground pressure, and caused a pole shift: different types of catastrophes!

And what *better* mechanism for the release of the gasses, than a *Great Flood* of ground water and other waters rising to the surface and releasing dissolved gasses, *en masse*? We propose that rising underground waters, as pointed out in ancient texts, were responsible for the flood, which occurred in an unknown time, causing a mythical mass extinction, via the release of volcanic gasses.

These would have had a selective effect upon the larger creatures, with smaller creatures more immune. The extinction included fabled 'Ancient Giants', 'megafauna' as well as dinosaurs (dragons?), which are in some cases, carbon-dated to about 30k BC.

We have previously proposed a *Sudden-Catastrophic Shrinking Earth*, mechanism in the past. We we believe that this caused the uplift of Tiwanaku, the creation of mountain ranges (how is *expanding* Earth going to do that, without our *Shrinking Earth*, also contributing?). Shrinking Earth would also have resulted in a change in the number of days in the year: (Ancient calendars have shifted from 360 to 365 days!)

Introduction

This is an article not intended for any peer review, (to be judged by the prejudices of today would be to interfere with the discoveries of tomorrow) but simply for publication on my website. This is information that I wish to disseminate to the wider public regarding the reasons for destruction of the ancient giants, and a little talk about their world!

"There were Giants upon the Earth in those Days!" (Pre-Flood) (Genesis, 6:4)

There is a story about Goliath, who is nine feet, nine inches tall! (Gen 6:4). His height is odd to say the least. We have huge giant doorways in many so-called megalithic structures. These are huge blocks built with high technology in an unknown time. These we have shown in youtube video, as recognised in works by archaeologist and artist Piranesi, and actually underly ancient Rome. They are found worldwide. The best *Youtube* channel I can recommend for the archaeology and architectural technique of this worldwide megalithic empire, is *Ancient History Criticisms*.

We certainly have a few giants living among us today, but what happened not just to gigantism in humans (if it was ever the case), but also in animals, almost every animal!? It has been suggested that on a smaller planet, less gravity meant bigger, spindly creatures. More oxygen in the past meant larger animals. However this would also have resulted in catastrophic wildfires which may have easily spread from continent to continent, so I don't like the idea of too much oxygen. In fact the carbon dioxide levels have radically altered in the past ten thousand years and this is a huge clue that metabolism has altered, or has been altered on the planet. It is a huge clue that the last ten thousand years was a post-catastrophic landscape in which the equilibrium changed. Life now is very different, therefore from life even ten thousand years ago!

'Cro—Magnon' humans, (who seem to have been, basically, tall Germanics) are suspected to have once existed, and were hunted to extinction. But how can *all* the animals have simply shrunk? It seems like a selective environmental pressure has been at play, independent of humans.

What happened to the megafauna? What happened to the dinosaurs!? This is crazy! They only seem to really live in Africa these days, in which place, they still live. It's a reason I don't really buy the 'hunting' explanation for their disappearance. More likely is that something adversely affected the northern hemisphere. In fact I would put the survival of the megafauna in Africa as partly down to the fact people now say that Africa was relatively unscathed by the Toba super-catastrophe of 60,000 years ago which resulted in a genetic bottleneck. That too might be part of this 'Flood' memory.

Did an extreme, selective 'hunting' pressure simply wipe out every large animal? This would not explain mammoths *trapped in ice*: clearly a kind of pole shift or sudden shift in ocean

currents! The hunting explanation would also not explain why there were giant creatures to being with, and why they were *not* being hunted, apparently!

And now it is time to talk about dinosaurs, because they are also part of this story. It all 'went down' around 2005, when Dr. Mary Schweitzer found and reported soft tissue in dinosaur bones. This soft tissue has now been turning up over and over. Firstly, soft tissue is not going to be found in any dinosaur bones that have been mineralised. Secondly mineralisation is the only way a dinosaur bone is actually going to survive for millions of years. Otherwise we are simply relying on an anaerobic environments for preservation, like a swamp, or even ice, and that cannot preserve for millions of years, as that environment would simply change. So what is going on?

I suspect that palaeontologists have skewed and discarded laboratory data for decades to ensure their discoveries actually get published. So, can the great catastrophic extinction of 65,000,000 years ago actually have occurred 30,000 years ago!? Well that suddenly becomes a possibility, since everyone has basically been lying! Or the system, due to the tendency of academics to act like pre-revolutionary aristocrats and endlessly sneer at their 'lower downs,' has forced people to lie in order to have a job.

The hunting explanation would also, not explain, dinosaur remains, which actually carbon date to 40k-20k years ago! (https://newgeology.us/presentation48.html) So, we can use this to place the catastrophe, or one of them, in about 30k B.C, just by taking an average. The paleochronology team in the above parenthesised article, found it hard to get labs to actually test their dinosaur bones for them, because they were terrified of the results! Now I am thinking that 65-million-year-old minerals percolated into more recent samples due to some upheaval, contaminating the results. Maybe a 65 million year old asteroid, once part of Earth, came smashing down again, in 30k BC. This littered old rock dust on young bones.

Let's play devil's advocate: 'We all know dinosaurs are from 65 million years ago... um even if they are found with feathers, as in China in 2004, and/or with flesh attached... and erm... even if a Triceratops bone from Dawson County, carbon-dates to only 33,500 years old!' Hmm! Funnily enough this time also corresponds to the formation of the Carolina Bays, which struck down from the north, a kind of bombardment!

Something wiped out the dinosaurs, the megafauna, and other animals, in very recent times. What is going on!? It happened around the time the dinosaurs date to, otherwise their bones could not have been preserved, catastrophically, in the time period they are found within.

Lake Explosions

A lake explosion is also known as a Lake Overturn. Such a thing occurred at Lake Nyos in Cameroon, 1986. It was a terrible disaster. For volcanic reasons, a temperature inversion occurred in the deep lake. The result was that eighty-million cubic meters of carbon dioxide, and god knows what else leached out. This cloud rolled 25 km to the south east, wiping everything out, killing every animal, including 1700 people!

Lake Monoun did the same thing, in 1984. Lake Monoun is located 62 miles away! This means it is not a singular lake which is responsible, rather a vast, huge outgassing from a considerable chunk of the planet, which seems to be able to erupt years apart. And voila, suddenly we have a mechanism for the great death found in the Great Flood. And we also have a mechanism for the selective destruction of larger creatures, as we shall see!

Eruptions of Lakes in Ancient Ireland

We are puzzled at the Ancient-Irish chronicles. In entries relating to the earliest times, written by ancient chroniclers, we see that they universally make mention that this or that lake ('laugh'), or river 'broke out,' in a particular primordial time.

Irish chronicled legends, seem to be suggesting that lakes literally erupted from underground, in human memory. This created a new landscape. In the *Annals of Clonmacnoise*, it is stated that when one early tribal migration reached Ireland, there were only three lakes and nine rivers in the whole land, but this number later expanded, possibly, and this is a guess, around the 2000s or earlier BC, as new lakes erupted from underground. (p. 15, *The Annals of Clonmacnoise*, 1896 edition).

In other words we see an unknown phenomenon, recorded by ancient humans, of 'Lake Creation'. It sounds like the Great Flood, in miniature!

So, were these new lakes, created by new underground rivers from the melting of the glaciers, or was something else responsible? Another thing about the chronicles are the periodic devastations in Ireland which seem to have killed everybody. For example, "Ireland 30 years after the death of Barthelome [an early king] was waste and desolate." (p. 14). It appears some catastrophe occurred but we do do not know what it was, and the chronicle is possibly trying to express this. A gas attack from one of those lakes?

The Selection of Smaller Life

I gleaned an interesting fact while reading Lovelock's 'Ages of Gaia', (1988). Let me pause to say: 'This is just incredible!' He stated that a small mouse is immune to carbon monoxide poisoning! It is so small that it can get oxygen into its lungs, via its skin simply due to diffusion, even if its atmosphere is saturated with carbon monoxide! This is despite the fact the carbon monoxide molecule binds to haemoglobin as opposed to oxygen. It's just nuts!

Could this *be the discriminatory system* which naturally selected away all giant creatures, say about 30k years ago? Did deadly gasses overflow the planet, selecting away the larger life forms?!

A subset of 'Sudden, Shrinking Earth'?

A while back, I released a theory based on the idea of a shrinking Earth. If the Earth shrinks, outflows of gasses such as carbon monoxide, will easily flood the planet!

In short, if the Earth can supposedly expand, having separated the continents, as people say, why can it not also shrink? I proposed a mechanism in the form of a volatile internal Sun. In fact this internal sun is possibly responsible for much in the way of secret (occult) phenomena. I have suggested it also as partly responsible for a kind of comet-tail-like, magnetic effect which occurs in the night. (UFO sightings, a type of aurora but at times coalesced into a luminous ball).

Let's say a shrink occurs. It has to be a sudden and catastrophic shrink because latest measurements suggest the Earth is not changing size. What happens next is that,

- Suddenly Tiwanaku is uplifted (who wants to live at that crazy-high elevation anyway?)
- Suddenly, Pole Shift on the entire planet occurs due to the non-equal nature of the implosion which causes the shrinkage. Through time this skew in the spin is magnetically and gravitationally stabilised, or by other unknown means.
- Mountain ranges are suddenly and catastrophically created. New folds of the Earth 's strata occur.

Ultimately, I think all the implosions and explosions are down to variability in the Earth's internal star.

The World Before the Great Flood

We can now speculate what the world before the Great Flood was like. We base some of this on a reading of Lovelock's 'Ages of Gaia.' There was a stronger sea smell. Lovelock mentions that a lower level of carbon dioxide, in primordial Ice-Age times implies there was actually more life on the planet, which was locking it up into trees and other forms. Lovelock is not a climate scientist, more like an engineer, and inventor! He looked at Earth as a unified system, whose environment is modulated and balanced by life upon its surface!

But ultimately, the sea smell, (there would have been more algae) was stronger. These algae live on coastal regions and evaporate sulphurous gasses into the upper atmosphere. This is one of their means of elimination, but the sulphur also serves to create seed-particle intermediates for rain clouds. I think this is why it rains on islands? As soon as the moisture hits the sulphur, evaporating from beaches, it begins to rain!

The rain then hits the coastal flats, rehydrating creatures about to die from salt overdose!

It seems that seas were saltier, as fresh water was presumably locked up in the glaciers. However, whether or not there were more glaciers or not is an interesting question since Siberia seems to have been warmer, with the UK and Greenland region much cooler. Was there a pole shift? Global temperatures do however seem to have been lower.

The Amazon rain forest, also was a type of grassland! If you look up the age of the Amazon we see talk of about 55 million years. Articles then say this does not include the last 2.5 million years, in which the Amazon was actually a kind of grassland! So, it did not really exist! If it did, its form and size was much reduced. This explains all the structures found under the forest, which I have suggested could be Ice-Age structures!

This long Ice Age period is known as the quaternary (a quarter of the Miocene). The Miocene is the last great period, lasting ten million years basically until today. In this time Antarctica became a refrigerator and Earth entered a long Ice Age, that we are still within, except for the current ten thousand years, the Holocene! The Holocene is a warm blip, resulting in our current human super-civilisation. This period failed to melt Antarctica, so the Ice Age is still going.

Grass evolved in this time, and became the prevailing condition. Look at how much carbon is locked up into a plant! A huge amount goes into a tree, but not much for the wafer-

thin piece of grass! Carbon Dioxide was lower in the atmosphere and trees had a hard time getting their carbon needs met.

In addition, grasses are a new type of more efficient metabolism of carbon known as C4, as opposed to C3, which is trees. The trees were basically dying out from the planet in the Miocene! In places like Ireland and Norway, it almost looks like there have never been any trees! We worry about deforestation today, but was there even an Amazon at all, six thousand years ago?

Now, it is not just temperature that went up 10k years ago! Carbon Dioxide started to also go up a lot! I have suggested before, reasserting the opinions of folks like Charles Mann, that the Amazon is an out-of-control garden. I have gone a step further saying its weeds were brought by trans-Atlantic and trans-Pacific contact, by ancient humans, basically.

Plot a chart and you will see that carbon dioxide levels have shot up over the last several thousand years, only! Coincidentally I think the Amazon was transformed from savanna into a kind of forest in this time, and it's all down to metabolism! Amazing eh!

The Ice-Age world had much larger temperature swings than today. In order to protect crops, vs. frosts and heat, I think farmers would have chosen temperate moist climates alone for farming. Possibly this would have been at sea level, along major rivers, the Nile, the Amazon etc.

I speculate that ancient human, Ice-Age civilisation had a huge presence in Sundaland, or sunken Indonesia, as well as in Thailand! I say this because Robert Schoch suggested Thailand as the original home of the pyramid builders. This is where copper work seems to have originated. I think it was just a bit of high tech, left over from a previous civilisation!

The Fallen Astronaut is our link to the High-Tech of the Past

Builders fabricate the Buddha statues so huge in Asia, because this was the fallen astronaut or ancient giant, which is being represented: a giant human. Note, he is in huge rock walls, because he is Loki, the rock is surrounding him!

He has fallen to Earth and is now trapped in rock, as per the Loki legend. His eyes are closed because he sleeps underground, but the legend is that he will awaken when his people

need him. This legend is applied to the likes of Barbarossa or King Arthur, giants of men, who possessed a strange genius or technology edge. I think it was originally applied to Loki.

The *Man in the Mountain* will awaken. It's the same as the pyramids, gods are inside them. I think the pyramids are in fact tombs for gods, tombs for the ancient astronaut, as I stated in my 2015: "In Search of the Origin of Pyramids." No world prehistorian, or archaeologist has yet contacted me to offer support. It's kind of sad how little curiosity these people have!

Thank you for reading!
